Outline

- Review - crystal symmetries, Weyl semimetals
- Symmetry protected topological metals - beyond Weyl and Dirac fermions
- Outlook - topological band theory

Outline

- Review - crystal symmetries, Weyl semimetals
- Symmetry protected topological metals - beyond Weyl and Dirac fermions
- Outlook - topological band theory

Review - Non-symmorphic Symmetries

- Structure of crystal symmetry group (space group) G
 1. Bravais lattice translations $\sim \mathbb{Z}^3$
 2. Point group $\bar{G} \equiv G/\mathbb{Z}^3$
 - Rotation & reflection symmetries of a crystal
 - 32 in 3D
- How many ways can we put \bar{G} and \mathbb{Z}^3 together (group extension problem)?

Review - Non-symmorphic Symmetries

- General element of a crystalline symmetry group: $\mathcal{G} = \{R|\vec{d}\}$
- $\{R_1|\vec{d}_1\}\{R_2|\vec{d}_2\} = \{R_1R_2|\vec{d}_1 + R_1\vec{d}_2\}$
- All space groups contain $\{E|\vec{t}_i\}$ where \vec{t}_i are Bravais lattice vectors
- Symmorphic group (73) - Extension splits: Every element can be written as $\mathcal{G} = \{E|n_i\vec{t}_i\}\{R|\vec{0}\}$
- Otherwise, non-symmorphic: elements with *fractional lattice translations* (157)

Review - Non-symmorphic Symmetries

- Example:

Non-symmorphic glide mirror $\{m_y | \frac{1}{2}t\}$

- This is the *frieze group* p11g

Review - $\mathbf{k} \cdot \mathbf{p}$ Hamiltonians

- Recall Bloch's theorem: $H(\mathbf{r} + \mathbf{t}_a) = H(\mathbf{r}) \implies H(\mathbf{r})\psi_n(\mathbf{k}, \mathbf{r}) = \epsilon_n(\mathbf{k})\psi_n(\mathbf{k}, \mathbf{r})$
- $\psi_n(\mathbf{k}, \mathbf{r}) = e^{i\mathbf{k}\cdot\mathbf{r}}u_{n\mathbf{k}}$ with $u_{n\mathbf{k}}(\mathbf{r})$ periodic

- Assume the solutions are known at some high-symmetry point \mathbf{k}_0 with symmetry group $G^{\mathbf{k}_0}$
 - Solutions fall into irreducible representations Δ of $G^{\mathbf{k}_0}$
 - We can expand
$$\psi(\mathbf{k}, \mathbf{r}) = \sum_n c_n(\mathbf{k}) \left[e^{i(\mathbf{k}-\mathbf{k}_0)\cdot\mathbf{r}} \psi_n(\mathbf{k}_0, \mathbf{r}) \right]$$

What is a Weyl Semimetal?

Two-band crossing in 3 dimensions:

$$H(\vec{k}) = d_i(\vec{k})\sigma_i; \quad d_i(k_x, k_y, k_z) = 0, \quad i = 1, 2, 3$$

3 functions, 3 variables - solution set is 0-dimensional (points);

Berry curvature:

$$H(k) = \vec{k} \cdot \vec{\sigma}$$

$$H(k) \left| \vec{k} \right\rangle = \mu \left| \vec{k} \right\rangle$$

$$a_i = -i \left\langle \vec{k} \left| \frac{\partial}{\partial k_i} \right| \vec{k} \right\rangle$$

$$\vec{\Omega} = \nabla \times \vec{a} = \frac{\vec{k}}{2k^3}$$

$$\frac{1}{2\pi} \oint d\vec{S} \cdot \vec{\Omega} = 1$$

Monopole of
Berry Curvature

What is a Weyl Semimetal

- Weyl nodes cannot be removed by small perturbations
- Gapped only through pairwise annihilation
- Nielsen-Ninomiya: Weyl points come in pairs of opposite chirality
- Must break either time-reversal or inversion symmetries; otherwise, can only get Dirac semimetals
- What are the observable consequences?

Fermi Arcs

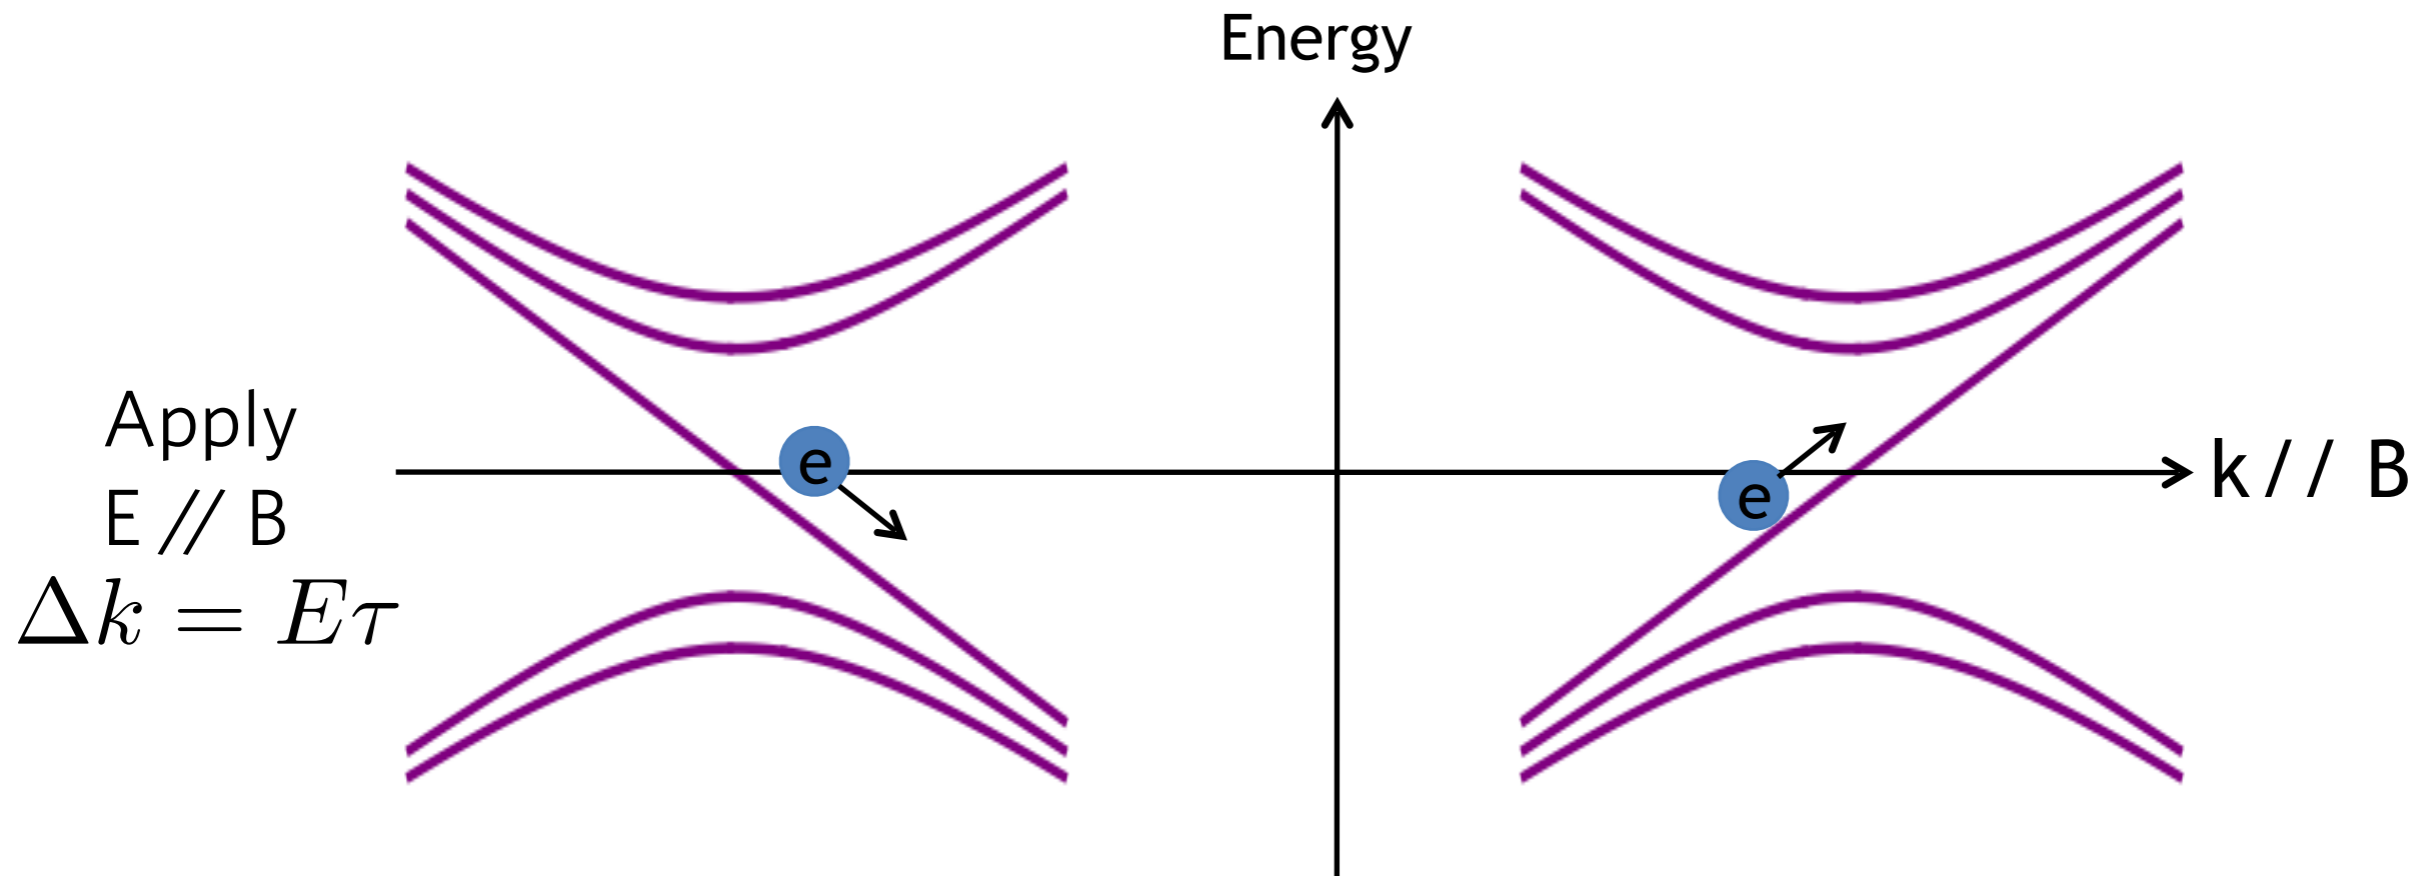

Fermi Arcs

Fermi Arcs

Chiral Anomaly in Condensed Matter

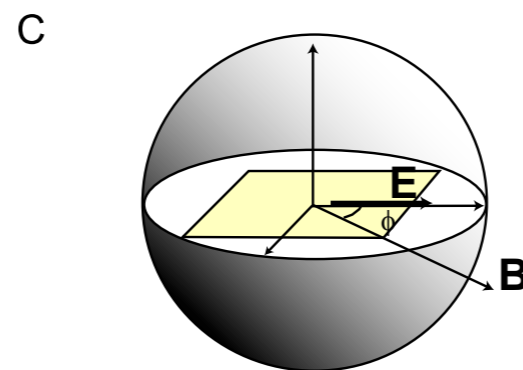

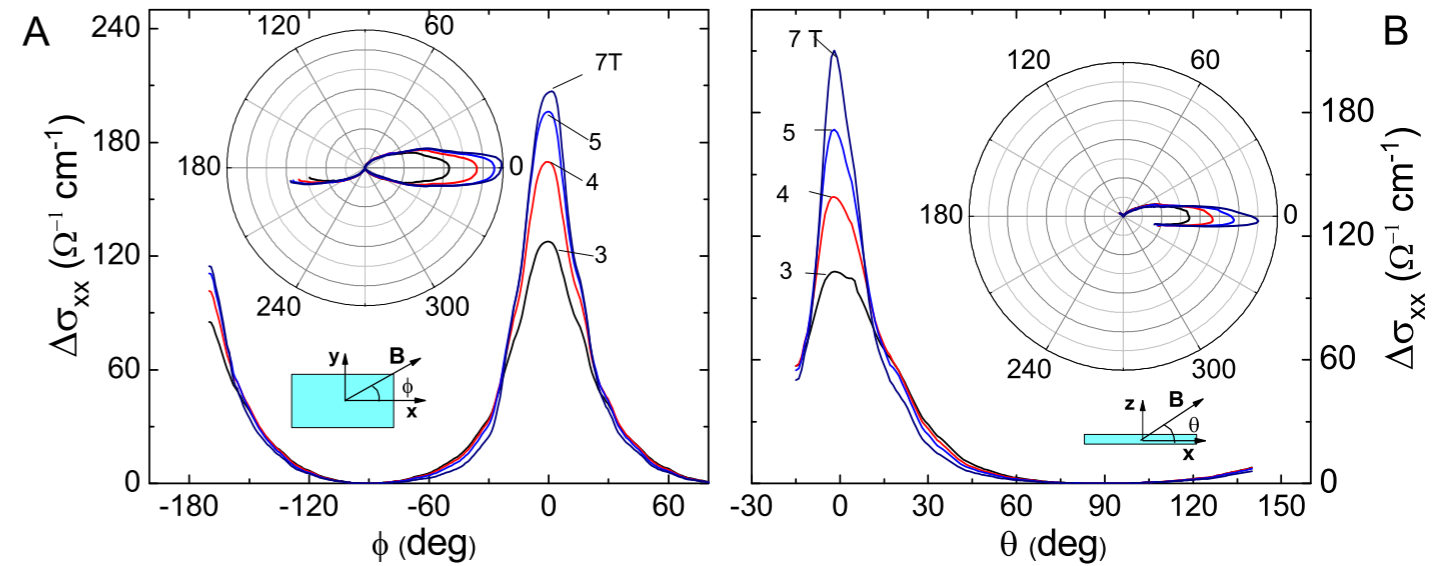

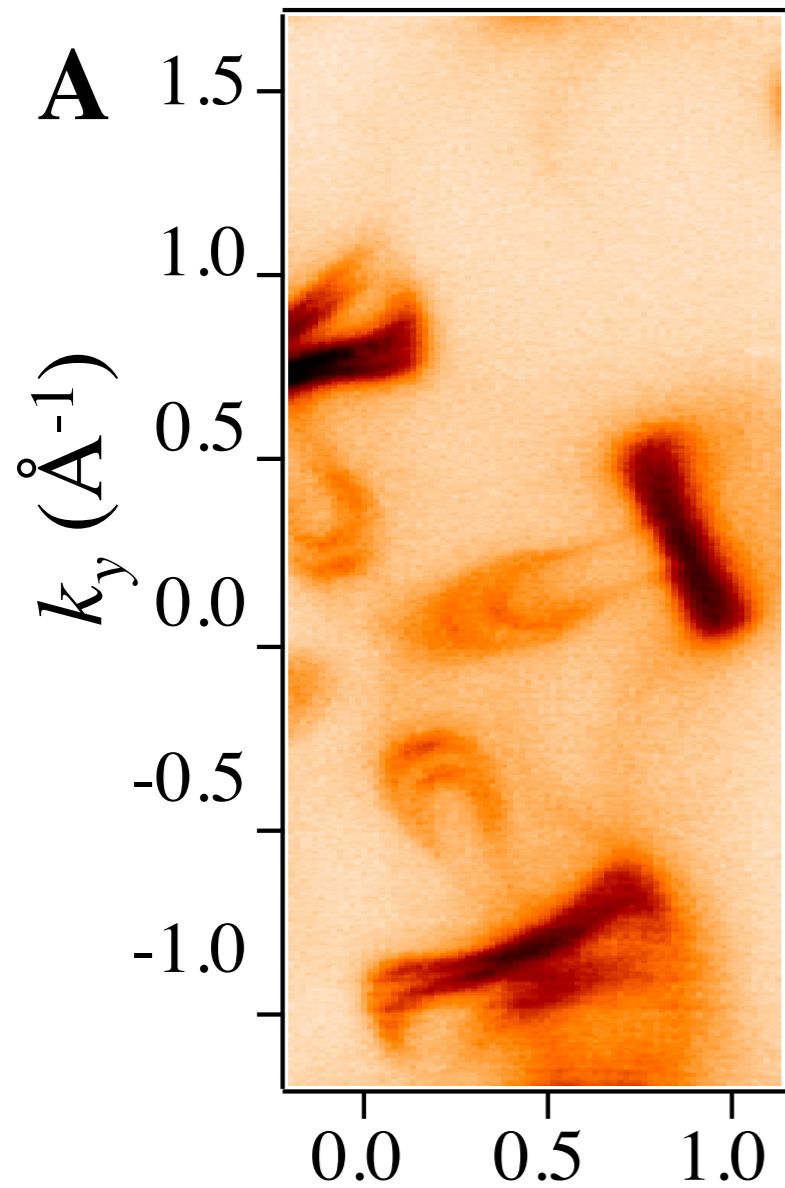

Electric field pumps charge between Weyl points:

$$\Delta N_R - \Delta N_L \propto E \cdot B$$

Manifestation of Adler-Bell-Jackiw anomaly

Cond. mat. perspective: Nielsen + Ninomiya, Vafeek + Vishwanath

Experimental Observation - TaAs, Na3Bi

Outline

- Review - crystal symmetries, Weyl semimetals
- Symmetry protected topological metals - beyond Weyl and Dirac fermions
- Outlook - topological band theory

Crystal Symmetry Protection

- More exotic fermions are allowed in crystalline systems
- New degeneracies protected by (non-symmorphic) crystal symmetries
- We focus on high symmetry points in the BZ
- Demand TR symmetry, allow for SOC
- Strategy - construct irreps of these symmetry groups, and the most general Hamiltonian consistent with each

Review - $\mathbf{k} \cdot \mathbf{p}$ Hamiltonians

- Recall Bloch's theorem: $H(\mathbf{r} + \mathbf{t}_a) = H(\mathbf{r}) \implies H(\mathbf{r})\psi_n(\mathbf{k}, \mathbf{r}) = \epsilon_n(\mathbf{k})\psi_n(\mathbf{k}, \mathbf{r})$
- $\psi_n(\mathbf{k}, \mathbf{r}) = e^{i\mathbf{k}\cdot\mathbf{r}}u_{n\mathbf{k}}$ with $u_{n\mathbf{k}}(\mathbf{r})$ periodic

- Assume the solutions are known at some high-symmetry point \mathbf{k}_0 with symmetry group $G^{\mathbf{k}_0}$
 - Solutions fall into irreducible representations Δ of $G^{\mathbf{k}_0}$
 - We can expand
$$\psi(\mathbf{k}, \mathbf{r}) = \sum_n c_n(\mathbf{k}) \left[e^{i(\mathbf{k}-\mathbf{k}_0)\cdot\mathbf{r}} \psi_n(\mathbf{k}_0, \mathbf{r}) \right]$$

Review - $\mathbf{k} \cdot \mathbf{p}$ Hamiltonians

- Symmetry constrains the Bloch Hamiltonian

$$\Delta(\mathcal{G})H(\mathbf{k})\Delta(\mathcal{G})^{-1} = H(\mathcal{G}\mathbf{k})$$

- Schur's Lemma: $H(\mathbf{k}_0) = \bigoplus_{\text{irreps}} E_{\Delta} \mathbb{1}_{\Delta}$
- For $\delta\mathbf{k} = \mathbf{k} - \mathbf{k}_0$ small, $H(\mathbf{k}) \approx \bigoplus_{\text{irreps}} H_{\Delta}(\mathbf{k})$

“Spin-1 Weyl” Fermions

- Space groups 199 and 214 at the P point $\mathbf{k}_0 = (\pi, \pi, \pi)$

“Spin-1 Weyl” Fermions

- Space groups 199 and 214 at the P point $\mathbf{k}_0 = (\pi, \pi, \pi)_{k_z}$

- Symmetries: $\{C_{3,111}^{-1}|101\}$ $\{C_{2x}|\frac{\bar{1}}{2}\frac{1}{2}0\}$

- We seek representations Δ compatible with

$$\Delta(\{E|\mathbf{d}\}) = e^{-i\mathbf{k}_0 \cdot \mathbf{d}}$$

- Spin-1/2 particles - 2π rotation must give overall minus

- 3-dimensional irrep:

$$\Delta(\{C_{31}^{-1}|101\}) = \begin{pmatrix} 0 & 0 & 1 \\ 1 & 0 & 0 \\ 0 & 1 & 0 \end{pmatrix}$$

$$\Delta(\{C_{2x}|\frac{\bar{1}}{2}\frac{1}{2}0\}) = \begin{pmatrix} -1 & 0 & 0 \\ 0 & -1 & 0 \\ 0 & 0 & 1 \end{pmatrix}$$

“Spin-1 Weyl” Fermions

- Linearized Hamiltonian

$$H = \begin{pmatrix} 0 & a\delta k_x & a^*\delta k_y \\ a^*\delta k_x & 0 & a\delta k_z \\ a\delta k_y & a^*\delta k_z & 0 \end{pmatrix}$$

- Topological properties: $a = i|a|$

$$H \rightarrow |a|\delta\mathbf{k} \cdot \mathbf{L}$$

- Nontrivial Berry curvature $\pm 2, 0$

- (c.f. $H = \mathbf{B} \cdot \mathbf{L}$)

Consequences - Surface Fermi Arcs

- Numerical check: tight-binding model for SG 214
- 4 atoms/unit cell, 3 p-orbitals per atom, 2NN hoppings
- Slab geometry, compute surface spectral function

$$A(k_1, k_2) = -\frac{1}{\pi} \text{Im} \left[\text{tr}_{\text{orb}} \left(\frac{1}{E + i\delta - H} \right)_{00} \right]$$

Consequences - Surface Fermi Arcs

Consequences - Surface Fermi Arcs

Consequences - Landau Levels

- Introduce magnetic field $k_{x,y} \rightarrow \Pi_{x,y} \equiv k_{x,y} + eA_{x,y}$
- Landau level creation/annihilation operators

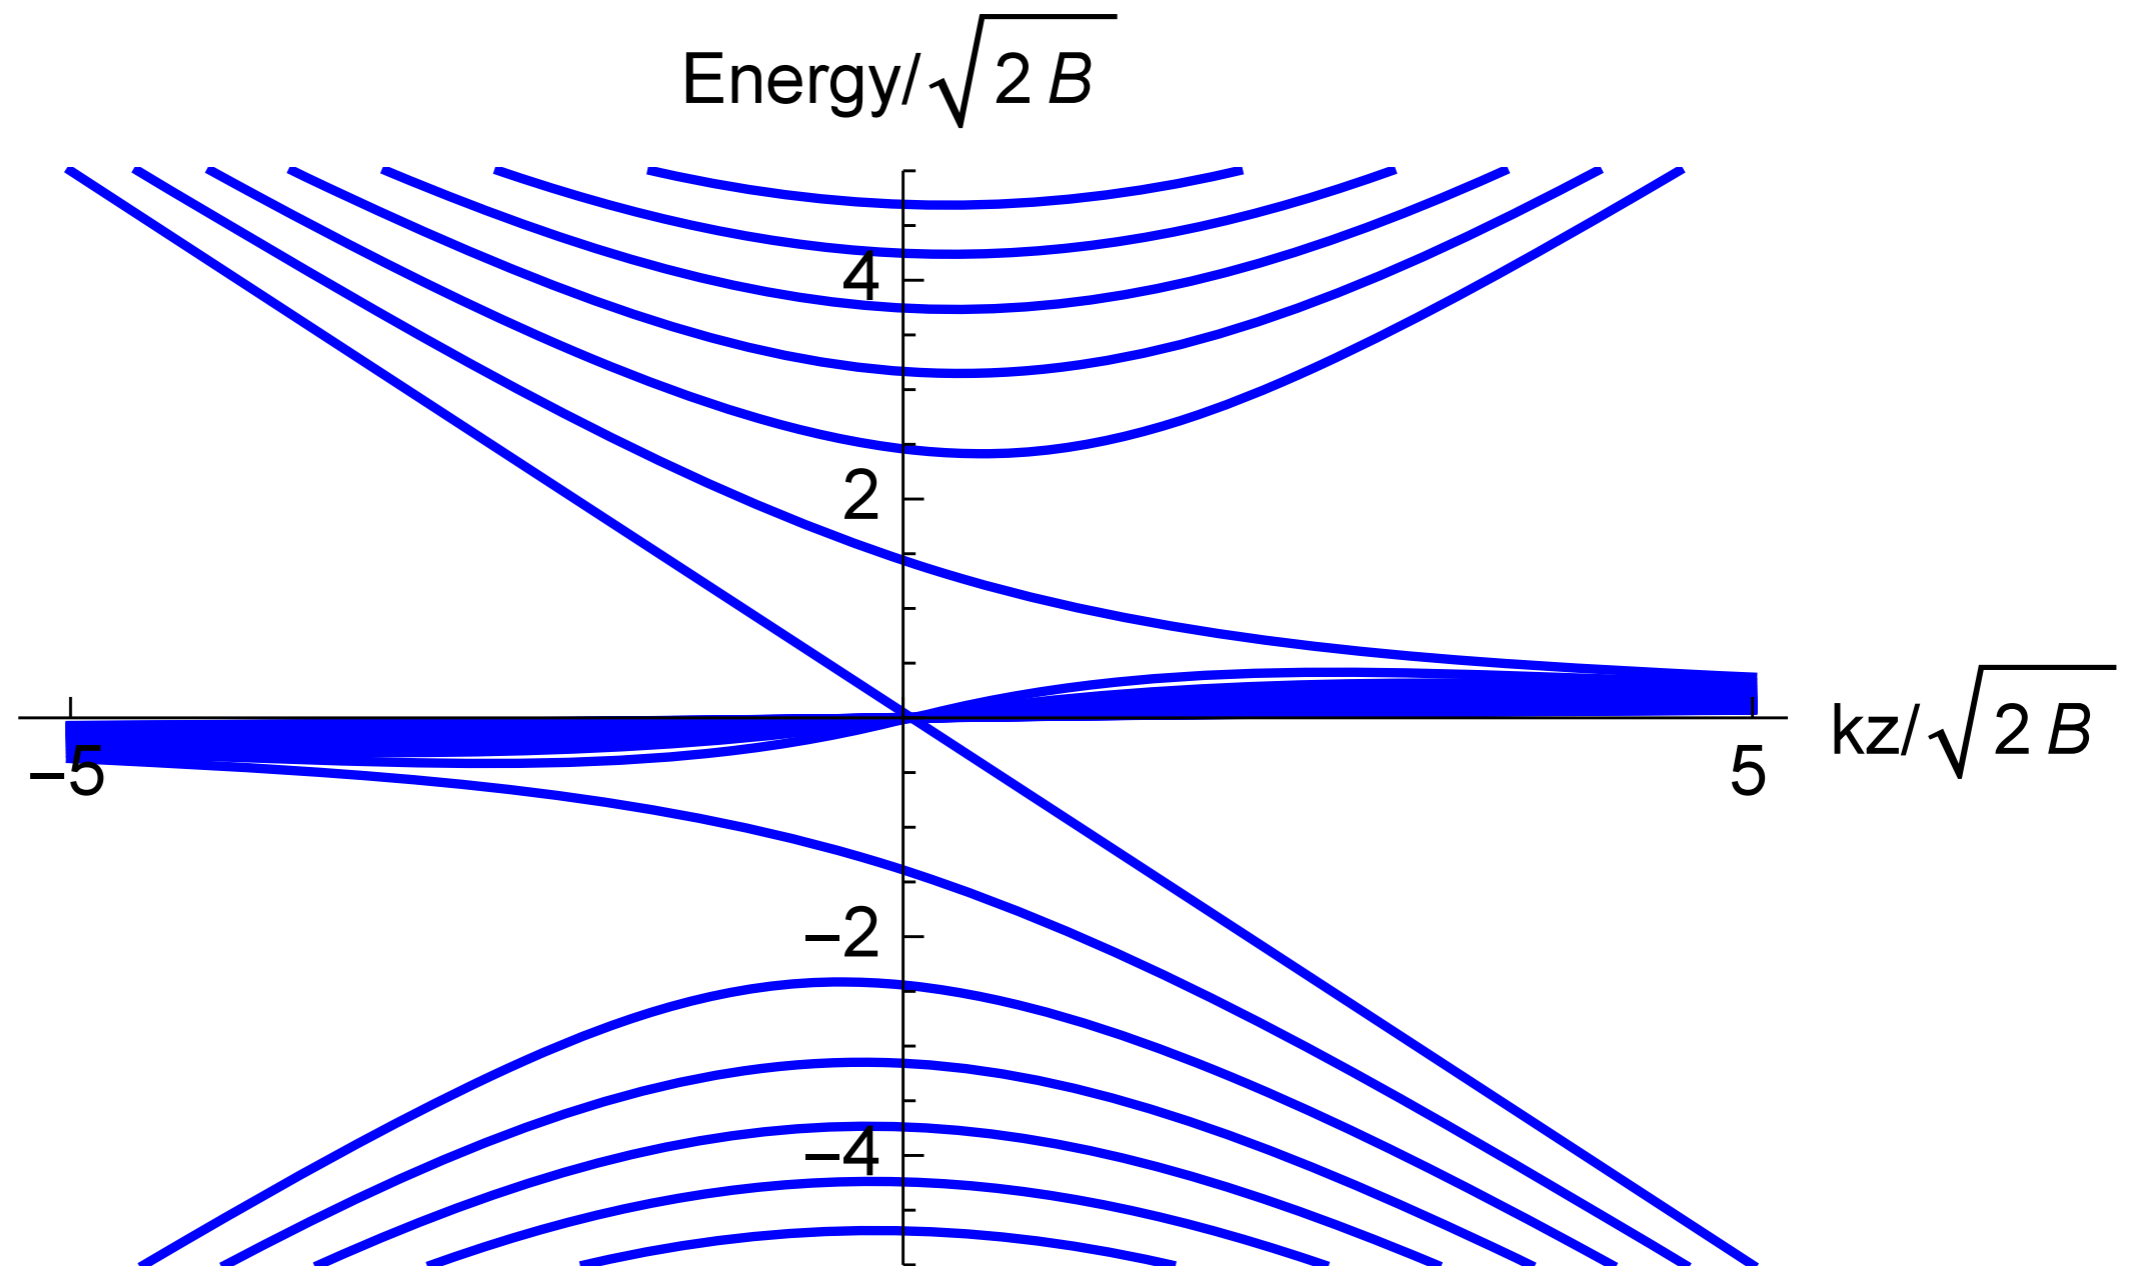

$$a = \frac{1}{\sqrt{2B}} (\Pi_x - i\Pi_y), \quad a^\dagger = \frac{1}{\sqrt{2B}} (\Pi_x + i\Pi_y)$$

- Linear Hamiltonian

$$H(B, k_z) = \sqrt{\frac{B}{2}} \begin{pmatrix} 0 & e^{i\phi}(a + a^\dagger) & ie^{-i\phi}(a - a^\dagger) \\ e^{-i\phi}(a + a^\dagger) & 0 & e^{i\phi}\bar{k}_z \\ ie^{i\phi}(a - a^\dagger) & e^{-i\phi}\bar{k}_z & 0 \end{pmatrix}$$

- Exactly solvable when $\phi = \pi/2$

Consequences - Landau Levels (Exact)

Consequences - Landau Levels (Higher order)

3-fold Degeneracy with Line Nodes

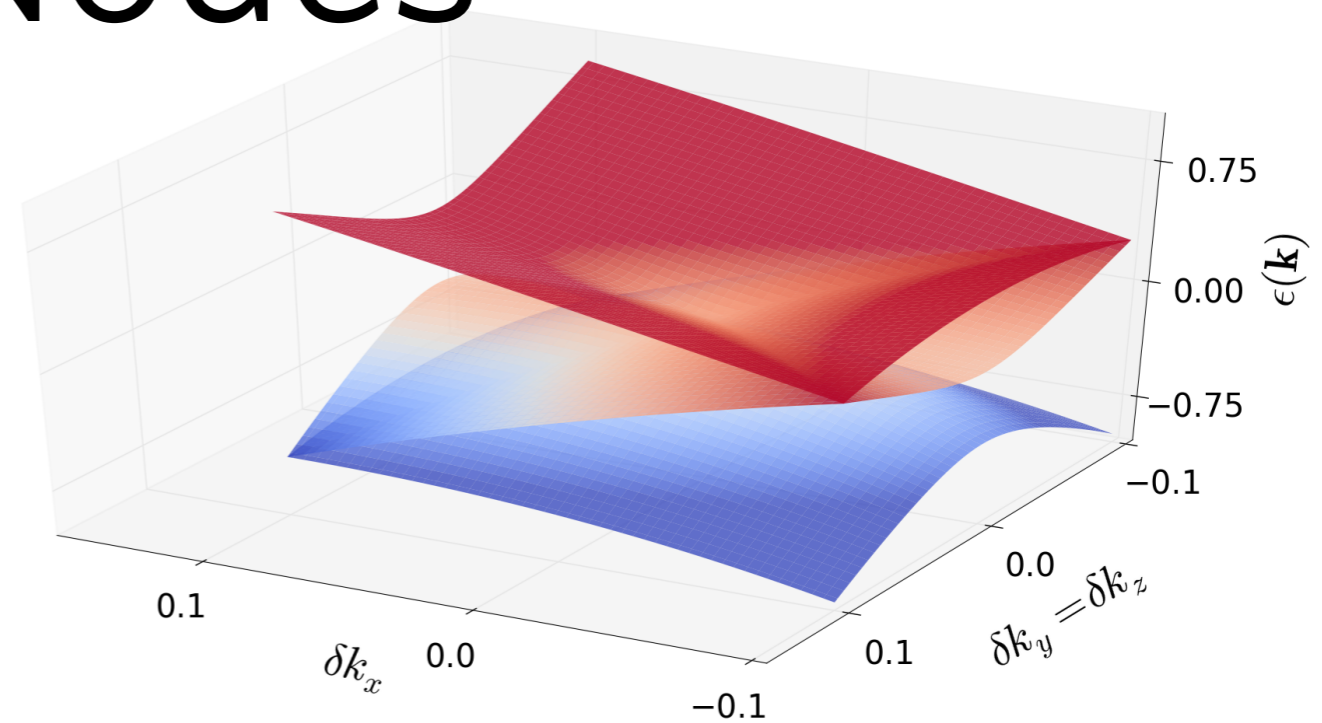

- Space group 220 at the P point

- Symmetries $\{C_{3,111}|000\}$
 $\{C_{2y}|0\frac{1}{2}\frac{1}{2}\}$ $\{IC_{4x}^{-1}|\frac{1}{2}11\}$

- Linearized Hamiltonian

$$H = a \begin{pmatrix} 0 & \delta k_x & \delta k_y \\ \delta k_x & 0 & \delta k_z \\ \delta k_y & \delta k_z & 0 \end{pmatrix}$$

- Spin-1 Weyl at a phase transition
 - protected line nodes

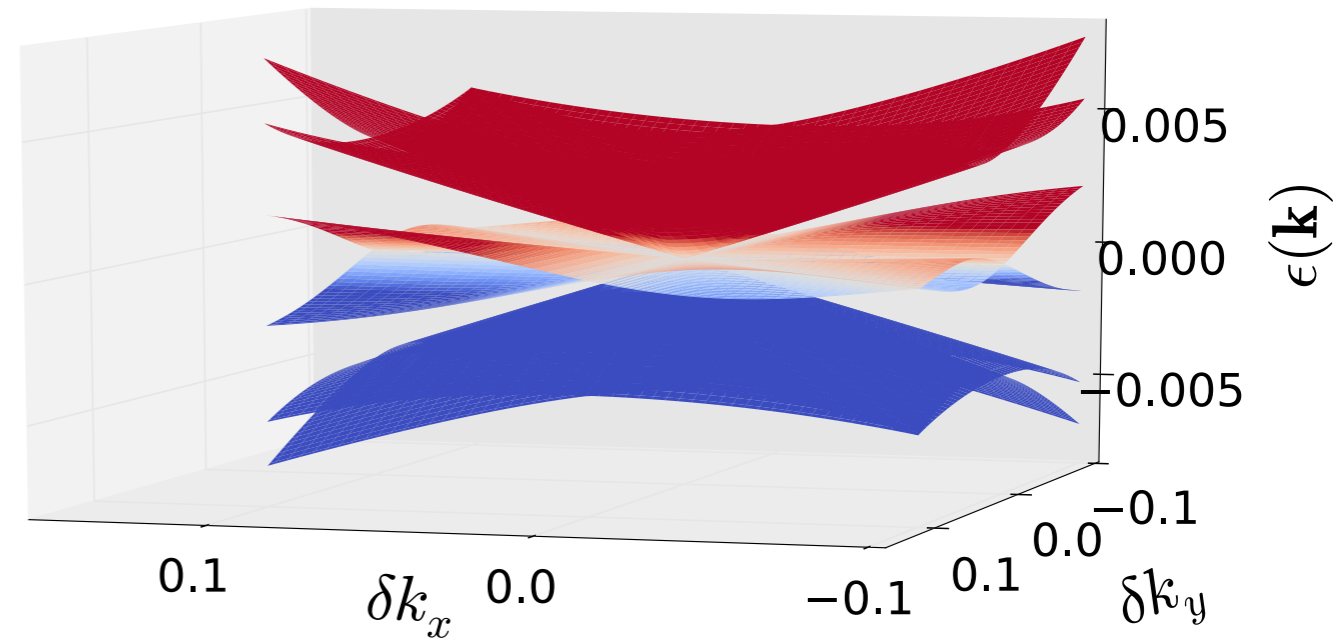

“Spin-1 Dirac” Fermions

- Space groups 206 and 230 at the P point
- Same symmetries as the spin-1 Weyl, but now also respects IT
- Two superimposed copies of a spin-1 Weyl
- No protected surface states (a la Dirac nodes at high symmetry points)

“Double Spin-1”

- Space groups 198, 212, 213
- Primitive cubic version of 199 - TR pairs two spin-1 Weyls
- No mirrors - these both have the same monopole charge
- c.f. Chang et al., arXiv: 1706.04600

Eightfold Degeneracy - Dirac Lines

- SG 130 and 135 at the A point
- **Only one** allowed representation of the symmetry group - 8-fold degeneracy required
- Can appear as an isolated feature at the Fermi level
- Mirror symmetry along BZ edges -> fourfold *Dirac* line nodes
- Zeeman splitting / Strain splitting -> Dirac, Weyl, and line-node semimetals, strong/weak TIs

Full Classification: Surface/Line Degeneracies

Due to nonsymmorphicity, T C2 squares to -1

Bravais lattice	Lattice vectors	Reciprocal lattice vectors
Primitive cubic	$(a, 0, 0), (0, a, 0), (0, 0, a)$	$\frac{2\pi}{a}(1, 0, 0), \frac{2\pi}{a}(0, 1, 0), \frac{2\pi}{a}(0, 0, 1)$
Body-centered cubic	$\frac{a}{2}(-1, 1, 1), \frac{a}{2}(1, -1, 1), \frac{a}{2}(1, 1, -1)$	$\frac{2\pi}{a}(0, 1, 1), \frac{2\pi}{a}(1, 0, 1), \frac{2\pi}{a}(1, 1, 0)$
Primitive tetragonal	$(a, 0, 0), (0, a, 0), (0, 0, c)$	$\frac{2\pi}{a}(1, 0, 0), \frac{2\pi}{a}(0, 1, 0), \frac{2\pi}{c}(0, 0, 1)$

Material Candidates

Outline

- Review - crystal symmetries, Weyl semimetals
- Symmetry protected topological metals - beyond Weyl and Dirac fermions
- Outlook - topological band theory

Band Connectivity

- Why are there so many bands?
- Momentum space perspective: Non-symmorphic symmetries force bands to stick together along high symmetry **lines**
- Ex: Glide Symmetry $g_x = \{m_x | 00 \frac{1}{2}\}$, $g_x^2 = -e^{-ik_z}$

With time-reversal symmetry, bands must come in groups of 4

$$\underline{+i \exp(-ik_z/2)}$$

$$\underline{\underline{-i \exp(-ik_z/2)}}$$

Review - $\mathbf{k} \cdot \mathbf{p}$ Hamiltonians

- Symmetry constrains the Bloch Hamiltonian

$$\Delta(\mathcal{G})H(\mathbf{k})\Delta(\mathcal{G})^{-1} = H(\mathcal{G}\mathbf{k})$$

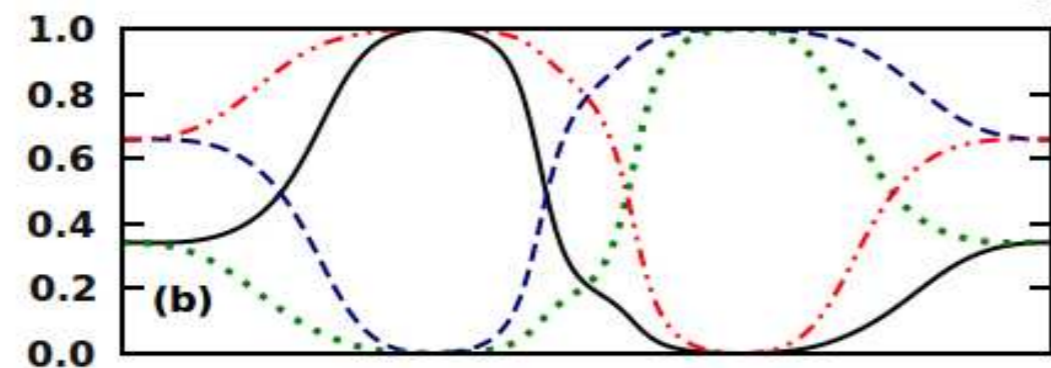

- Schur's Lemma: $H(\mathbf{k}_0) = \bigoplus_{\text{irreps}} E_{\Delta} \mathbb{1}_{\Delta}$
- For $\delta\mathbf{k} = \mathbf{k} - \mathbf{k}_0$ small, $H(\mathbf{k}) \approx \bigoplus_{\text{irreps}} H_{\Delta}(\mathbf{k})$

- Local in momentum space -> Misses connectivity and topology

Bigger Picture

- Global band topology (and geometry!) determines a set of Wannier functions for each gapped band
- Topologically trivial \rightarrow these Wannier functions are smoothly deformable to atomic orbitals while preserving symmetries

Ex: Graphene

[Soluyanov & Vanderbilt (2011)]

Bigger Picture

- By combining representation theory with band topology, **we have applied this logic to all 230 space groups.**
- *Predictive* classification of non-interacting TCIs
- See next talk for more details
